---

**Symptom**

You see an Outgoing Notification error message. When you go to the Notification, you cannot remove the email from ILLiad.

**Applies to**

- ILLiad

**Resolution**

On a Self-Hosted site, you will need to do the following.

1. Go to the Transaction and look at your History.
2. Go to the Email History and find the Email that is highlighted in Red. Give the ID to your SQL Administrator.
3. The SQL Administrator will be able to remove the Notification. If the ID is 12, this is what the SQL Admin can do. The Example is for a single server.

Use ILLData

```sql
GO
Delete From EmailCopies
Where ID = '12'
GO
```

If you are hosted, we will take care of the requests. If you give us the ID, that will speed up the time it takes us to process the request.

**Additional information**

This is usually because a record did not have an email address in it or there was an invalid email address. ILLiad is unable to send the request.
