The character used to designate subfields in records has changed from a dagger symbol, how do I change it back?

Symptom

- The dagger character (‡) used to display between subfields in Connexion, and now it is not. Instead I see a eszett character (ß) is displayed

Applies to

- Connexion Client

Resolution

This issue is due to a change in the Connexion Client font settings.

1. From inside Connexion navigate to Tools > Options > Font
2. "System" is the default setting here for Windows 10. If the setting is not "system" change it to be "system".
3. If the setting is already "system" change it to a font and check to see if this clears the subfield display issue.
