Learn how to use the HAName config.txt directive with the HAPeer directive to create high-availability EZproxy configurations across servers.

**HAName** is a position-independent config.txt directive that typically appears toward the top. It is used in conjunction with **HAPeer** to create high-availability EZproxy configurations across two or more servers.

For more information, see [Configure high availability](https://help.oclc.org/Library_Management/EZproxy/Configure_resources/HAName).
